It is longest ORF found in the sequence. Sequence displays some of the characteristics of other malaria nucleic acid sequences: tandemly repeated molifs, high AT content and a corresponding preference for codons containing these bases, and a high content of codons for glutamate. Three major repetitive sequences are: one motif from bp 34 to bp 156 is repeated from bp 289 to bp 411; another motif from bp 577 to bp 521 is repeated tandemly twice from bp 522 to bp 566 and from bp 567 to bp 611; a third motif from bp 1174 to bp 1233 is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        18742 TCTCTTTCTGTTTTGAATTTGCTTATAAATTTTTTGTAACTTTCAGAAAATTTAAAATT 18683

repeated tandemly 11 times. This last repetitious region consists of 360bp repeats differing only in 3 bases GAT coding for aspartate. This region is flanked to the 5' terminal of a degenerated 60 bp repeat. GC content of the conding part of the insert is on average 30%, and of the non-coding 3' terminal 11%.

Disclosure; p; English.
Sequence allows for production of antigenic malarial proteins, useful in diagnosis, prevention and treatment of the disease. The sequence may be used in an expression vector; and signal and regulatory sequences may be used to stimulate production of other products.

                                                                                                                                                                 Plasmodium is
                                                                                                                                                                                                                                                     (A) specific probes and primers (see V31139-56). The method is used to diagnose Plasmodium infection. Also (not claimed) the polypeptides encoded by (A) are useful as targets for drug. development and for development of anti-malaria vaccines. The high degree of similarity between (A) from different species allows development of genus- or species-specific assays that result in Sequence 5849 BP; 2296 A; 673 C; 557 G; 2323 T;
                                                                                                                                           gene of the solid modern control of the TRNAS, tribosomal proteins and RNA polymerase subunits, amongst others Plasmodium is detected in a human or animal sample by treating it, or derived nucleic acid, with a plasmodium extrachromosomal genetic element or derived nucleic acid (A) and detecting any hybridisation. (A) can include the PSI-PL470, PLH-PPH, PRB or PWO gene, the mitochondrial coxI gene, and nucleic acids derived from them. Also new are
                                                                                                                   is the nucleotide sequence of one strand of the PSI-PL470 of the 30.7 kb extrachromosomal plastid of Plasmodium berghei.
                                                                        extrachromosomal element - providing genus or species specific diagnosis with few false negatives, in humans or animals.
                                                                                                                                                                                                                                                                                                                                                                                                              DB 1; Length 5849;

vaccines to control malaria
Claim 1: Page 12-14: 17pp; German.
Glycophorin binding protein 130h is a P.falciparum blood stage
antigen 69% homologous with the known GBB130. The GBP130h gene and
its homologues can be used in vaccines to protect against malaria
caused by P.falciparum. The coding sequence was isolated using PCR
techniques on a genomic P.falciparum FCBR strain library. The
GBP130h gene was found to be highly conserved between different
strains but is distinct from the GBP130 gene.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    from
                                                                                                                                                                                                                                                                                                                                                                             This sequence was finished as follows unless otherwise noted: all regions were double stranded or sequenced with an alternate chemistry; an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was
                                                                                                                                                                                                                                   NOTICE: This sequence may not represent the entire insert of this colone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.

Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
